

PRESS RELEASE 2nd December 2008

LISA Airplanes introduces Hy-Bird project in Courchevel at the Planetworkshops.

LISA Airplanes is going to exhibit its project of ecologic light aircraft, Hy-Bird, at the third edition of the Planetworkshops, held from 11th to 13th December in Courchevel (Savoie), a prestigious ski resort.

The Planetworkshops are a meeting place bringing together decision-makers from diverse fields – business leaders, academics, NGO representatives, political leaders, media— to work together on the serious challenges of sustainable development.

Deeply involved in sustainable mobility, Hy-Bird project has been invited to participate in the Planetworkshops. Vanessa Troillard, Hy-Bird project manager, will be there to show that technologies and innovations used in Hy-Bird can meet this ambitious challenge.

Hy-Bird is a 100% clean and electric aircraft. This airplane works with solar energy stocked in batteries and hydrogen converted into electricity through a fuel cell. To design this futuristic aircraft, LISA Airplanes uses the skills and know-how acquired while developing its first airplane, AKOYA. Thus, Hy-Bird has the same fuselage and aerodynamic qualities providing it low energy consumption.

LISA Airplanes wishes to show how sustainable mobility can be applied to light aviation and will point out those technologies and innovations through a Round-the-World by stages.

LISA Airplanes will therefore demonstrate that performance, comfort and freedom can go hand in hand with "respect for the environment."
